NVI 30 January 1953 (ARTHUR N. HERRON & Tow 8-3 Bd)

From: Chief, Merchant Vessel Inspection Division

To: Commandant

Via: Chief, Office of Merchant Murine Safety

Subj: Marine Board of Investigation; fire involving Tug ARTHUR N. HERRON and tow, Schuylkill River, 18 November 1952, with loss of life

- 1. Pursuant to the provisions of Title 46 C.F.R. Part 136, the record of the Marine Board convened to investigate subject casualty, together with its Findings of Fact, Conclusions, and Recommendations, has been reviewed and is forwarded herewith.
- 2. On 18 November 1952, during the nighttime, the motor tug ARTHUR N. HURON, 175 g.t., with a loaded mud seem alongside, was under way in the Schuylkill River, engaged in local towage. In the vicinity of Yankee Point, she evidently entered into an area or space of inflammable or combustible material which apparently was ignited by the flame of an oil lantern on the seem; immediately the tug and tow because enveloped in a sea of flame. The weather was clear and calm and the tide had just begun to flood. As a result of this casualty the ARTHUR N. HERRON suffered fire damage and the following two crew members lost their lives:

Arthur Milan, Engineer Donald Worrell, Deckhand

- The Board made the following Findings of Fact:
 - "l. The tug ARTHUR N. HERRON sustained damage to her superstructure above the main deck as a result of encountering an area of burning material in the Schuylkill River, Philadelphia on 16 November 1952 at about 2230 EST. Two crew members of the HERRON were unaccounted for after the fire and later one body was recovered; the other is still missing and presumed dead.
 - "2. The ARTHUR N. HERRON, Official No. 223540, is a diesel powered tug of 175 gross tone, built in 1924 and is uninspected. She is owned and operated by the American Dredging Company of 12 South 12th Street, Philadelphia, Pa., and is customarily employed in dredging operations in or near the Philadelphia waterfront. At the time of the casualty James M. Taylor, 105 Congress Avenue, Oaklyn, N. J.,

wat in command of the vessel. Hr. Taylor holds no valid measure corridioses, but at one time held a motorboat operator's license which had expired.

- "). The seather at the time was clear, light airs and the sea smooth, and the tide had just begun to flood. The tidal currents are not strong in the Schuylkill.
- The personal who lost their lives are as follows:

Arthur Milea, Morristown, N. J., Engineer (body recovered) Donald Worrell, Mt. Ephreim, N. J., Deckhand

- The RTIME W. HERRON, with a loaded, unsummed mud scott #122 made fast clongside to port, left the Dredge BALTIC at Point Breeze, Philadelphia, at about 2135, 18 November 1952. Prior to leaving the BILTIC the HTRNON had delivered a light scow alongside and intended to tow the loaded #122 to a mooring at Mantua Creek. On the trip up the river and again when she left the BALTIC, the scows carried open flame lanterns on each outboard corner as running lights. After the HERRON aquered away downbound in the river with her tow, she proceeded uneventfully as far as a point below the bend at Yankee Poin; when the acting master, who was at the wheel, blev the whistle to call a seamen to the wheelhouse. Worrell, who was in the golley, answered the call and relieved Taylor who went below to the galley. He obtained his coffee and stopped out on cack on the starboard side to talk to the engineer, Milan, At this moment the tug, without any warning, was enveloped in a sea of flame. Taylor jurged into the engine room and ordered the engines stopped. He then ordered thom full astern, an order which was also carried out while an attempt was made to close the ports and doors to keep out the smoke and flame. He then ordered the engines stopped and shouted for all hands to jump overboard, as he himself handed for the stern.
- "6. Paul Bugoski, oiler, stated that soon after making his ten o'clock round, he noticed a peculiar smell and on going to a port hole on the port side was suddenly confronted with a wall of flame. He shut the port and retreated to the center of the engine room where he encountered Harrington, a deckheni, in the smoke. They obtained life jackets and made their way out of the engine room aft where they jumped overboard. Bugoski remembers seeing the lower part

HVI 30 January 1953 (ARTHUR N. HERRON & Tow 8-3 Bd)

of the engineer's body through the snoke near the throttle and he did not see him thereafter. Bugoski also stated that he heard an explosion just before he noticed the flame.

- "7. Juin Molinley, cock, was in his bunk in the after room on the main deck, having gone there when worrell relieved Taylor at the wheel. He was reading, with a redic turned on when he heard the sound of an explosion, the force of which parted the rope yarn with which the door was accured, blowing it open. The ship seemed to be invadiately enveloped in flame, and as he tried to leave the room him pajames cought fire. He attempted to go amidships to the engine room and reached the starboard door where leave Milan at the throttle and the captain, who should to get out. McGinley jumped over the sterm, and later in the hospital was found to have suctained first and second degree burns.
- "8. Harrington, the other survivor, was in the galley when the fire was noticed and he fellowed the deptain towards the engine room. He also saw Milan just prior to leaving the engine room. He was pushed overboard by Rugoski. Harrington also testified that he saw Milan just over the stern into the river and he heard calls for help from him, but in his sumjety to get ashore, did not pay any more attention to his shipmate. Harrington was also treated for first degree burns.
- "9. All four of the survivors summ from the burning HERRON to the Gulf Reflining Company dock about 600 feet upstream from Penrose Avenue Bridge, where they were assisted from the water by Gulf Refining Company employees. None were seriously injured but were taken to the St. Agnes Hospital.
- "10. Two employees of the Gulf Refining Company, Mr. Bail Blassinger of 298 Burnod Avenue, Camden, N. J. and Mr. Samuel S. Moroross, 3rd of 632 Eric Street, Camden, N. J. were eyesitnesses to the entire incident with the exception of the actual start of the fire. Both stated that while engaged in their several duties, Elessinger in a position

were the large and Horoross below it, their attention was appropriated to the sudden glare in the sky. Each ran towards it, hererous stopping to sound a fire alarm, and they resulted the river back where they can the HERRON and her has revolepud in flame. Norcross described the fire. "like In sopes to rug", burning on the curlace of the river. Imp also estimated that the burning area extended from a point about 200 fact above the Punrose Avenue Bridge to a point about of the sold dock of the Gulf Refining Company, and from aid channel towards the western bank. Blessinger had looked at a clock just before he noted the plan of flame and placed the time as 2226 or 2227, and this is examinered the most accurate time given of all the witnesses, Both of the man, assisted by other Gulf employees attracted to the some, saw the crew of the HERRON entireing for shore and helped them from the exter as soon as they came within reach ."

The Scard made the following Conclusions:

h.

- The most probable cause of this casualty was the presence of an inflammable substance at or near the surface of the Schuylkill River and covering an area of about 500 yards long by 100 yards wide in a westerly direction from the center line of the channel, and extending in a northerly direction from a point about 200 feet north of the Penrose Agenus Bridge. The most probable igniting agent for the substance was considered to be the two open flame lanterns carried on the outboard corners of soos #122.
- "2. None of the surviving witnesses actually saw the beginning of the active combustion, even though all were within a few feet of the water surface due to the size of the tog. The only positive witness, as disclosed in the investigation, who might have seen the beginning of the fire was the helmssen, Worrell, and he did not survive.
- "3. It is also deduced from the testimony that the inflammable substance was probably not on the river an hour prior to the casualty, when the HERRON transited the area with the same rig.
- The banks of the Schmylkill River from the mouth to Point Breeze, Philadelphia provides water access to

the U. S. Mary Yord, the Gulf Refining Company at Circuit Point and the Atlantic Refining Company at Point Breese. Those are all on the easterly or Philadelphia side of the river, and the Standard Oil Company has a nior at Harkness Point, seroes the river from the Point Breeze property of the Atlantic Religing Company. The remainder of the western bank to the mouth is low, swappy and part has been used as a sumicipal drapt. Several pipelines, the property of the Oulf Rafining Company, pass under the giver in the area under discussion. The possible sources of an oil spill in the immediate vicinity were two Gulf tenkers, the OULFLUB! and the GULFRING. The bulls of each of these vessels were inspected and bore no signs of an oil spill, or any marks of recent cleaning, above the scene of the fire and around a bend in the river were the oil barges MCRAVIA, FRANKLIN and W. A. W. MSUR; all at the Atlantic Befining Company. A dry cargo vessel, the ROBIN KETTERING, was also at their docks, but all of these vessels were over a mile shows the fire and behind two bends in the river channel, honce there is considered little likelihood that a spill in their area of the river could have drifted to the some of the fire. Across the river from the Atlantic Refining Company piers, the GATOO #7:, another oil barge was louding greatine at Harkness Point. The possibility of her supplying the oil was also considered unlikely for the same reasons as the wessels at the Atlanthe Docks, that is, the configuration of the river banks and the distance from the scene of the fire. At the U.S. Nevy Yard on the Schuylidill side, at wherees George and How, there were several craft. some in and some out of commission. These also were considered whilely sources, again on account of the configuration of the river, the distance from the scene of the fire and the fact that the tide had been shbing until just before the casualty. Each agency having frontage on the river was questioned for a possible source of an oil patch that wight have caused the Mre, but all denied any possibility of such an occurrence. It was further pointed out by Gulf Refining officials that the fire never burned bayond the mid channel line in the direction of their piers, another indication that the source of the fire did not originate on the eastern side.

- The possibility that fuel oil had been spilled from road building machinery on the Penrose Avenue Tridge was also considered, sime the fire was only a short distance above the bridge. A close scrutiny of the entire bridge structure disclosed no evidence of an cil mail. The foreman in charge of the road building operations stated that no night work was done on the bridge and due to deprodations to his gear, he contourly had all working material including all the machinery, moved from the bridge, looked up under guard in a construction should about a mile from the river bank on the western side. His explanation was supported by the Philadelphia Police who putted the bridge and in the light of the conditions observed by the Boord, was considered adequate.
- The possibility of the fire originating on the tog or scow was eliminated in the latter instance by the steel hull and the load of water and mod, and in the case of the former in that the fire only burned the superstructure and the character of the demage plainly indicated burning from without. There were no indications of any fire below the main dock of the HTEROH.
- The lifebelts used by the survivors showed no evidence whatsoever of having been in contact with any petroleum or derivative of petroleum. As a matter of fact, one of the block cork type belts which had been used was remarkably clean. Other then the cook, who was not considered the most reliable witness, none of the survivors tested oil on the water when they jusped overboard, nor did any complain of any oily substance in their eyes or surs, an almost inevitable concemitant of smirring in oil polluted water.
- "8. Representatives of the City of Philadelphia Fire Department and the U. S. Army Corps of Engineers attended the investigation and each confessed himself to be as baffled as the Board as to the material that caused the fire or an explanation for its presence on the river.

5.

30 January 1953 (ARTHUR D. HLARON & TOW a-3 8d)

Since Morrell, the helmsman, and only possible eyewitness to the start of the fire, died us a result of this currently; and since the combustible material on the surface of the sater was consumed by the Mrs, it is considered that the two best sources which could have led to some identification of the egent which coused the fire were destroyed by it. It is further considered that the camualty was of the "freak" muristy, a contribution of circumstances so unusual as to render a recocurrence extremely unlikely."

The Board made the following Recommendation:

Instruct as no licensed or eartificated personnel were involved in the cosmulty, no option under R.S. 14150 is considered indicated and none is recommended. Further, the HINEN was unineperied and no Coast Guard approved material was involved. It is therefore recommended that the case be closed with no further action."

6. It is recommended that the Findings of Feet, Conclusions, and Resourcendation of the Harine Doard of Investigation be approved.
